# Chemical Spill Response — Bench Job Aid

Keep this at your workstation. Follow all 7 steps, in order, every time.

1. **Assess**
   Consult the SDS or label first. Never identify a chemical by sight, smell, or touch.

2. **Alert & evacuate**
   Warn the people nearby and clear the area. People always come first.

3. **PPE**
   Put on gloves, goggles and apron before you approach the spill.

4. **Contain**
   Ring the spill with absorbent, working from the outside in, away from drains.

5. **Correct kit**
   Match the spill kit to the chemical. Water-reactive means a dry kit — never water.

6. **Dispose**
   Place waste in the labelled hazardous-waste container only — never the general bin.

7. **Document**
   Complete the incident log and notify your supervisor.

> **If you are unsure what the chemical is — STOP and check the SDS.** Skipping a step is both a safety risk and a compliance deviation.
